Our newly developed general framework efficiently computes the Two-Photon Spontaneous Emission rate of a quantum emitter positioned near any photonic structure beyond the dipolar approximation. This is particularly relevant for plasmonic nanocavities, which exhibit highly confined light. Interestingly, the influence of the environment is determined through the classical computation of Purcell factors via electromagnetic simulations, avoiding tedious analytic calculations. We show that placing a hydrogen-like emitter close to a silver nanodisk enhances the two-electric dipole and the two-electric quadrupole transition rates by 5 and 11 orders of magnitude, respectively. This discipline promises, for example, efficient entangled photon sources.

Background

• Two-Photon Spontaneous Emission (TPSE) processes: second-order processes, 8 to 10 orders of

magnitude slower than the competing single-photon spontaneous emission [1]

- **2D plasmonic nanostructures:** ideal to harness two-quanta emission processes [2]
 - \rightarrow Light confinement at the atomic scale
 - \checkmark Light emission enhancement via the Purcell effect by several orders of magnitude [1, 3]
 - \checkmark Breakdown of the electric dipole selection rule [3] \rightarrow Forbidden transitions accessible [1]

X Study of advanced nanostructures hampered by a lack of efficient numerical and theoretical methods

Need for an efficient and general framework which goes beyond the electric dipole approximation by considering higher-order multipolar contributions to second-order processes

tnis

Second-order transition: an excited emitter emits a first quantum ω then emits a second quantum $\omega_{eg} - \omega$ from a virtual intermediate state

Framework [4]

System → Perturbative approach

Quantum Interaction studied up to emitter 🏠

rate given by Fermi's

Second-order transition

electric quadrupole order

Application

Plasmonic nanostructure of arbitrary shape

Relation between the TPSE rates and Purcell factors

- \rightarrow Muniz: 2ED transition, only for symmetric structures [2]
- \rightarrow Our work: 2ED, 2MD and 2EQ transitions, also for asymmetric structures

$\frac{\gamma_{2\mathrm{ED}}^{(2)}(\omega;\boldsymbol{R})}{(\gamma_{2\mathrm{ED},0}^{(2)}(\omega))}$	$=\sum_{i,j,a,b=1}^{3}$	$\hat{\mathcal{D}}_{iajb}^{eg}(\omega,\omega_{eg}-\omega) F_{ij}^{\mathrm{ED}}(\omega;\mathbf{R}) F_{ab}^{\mathrm{ED}}(\omega_{eg}-\omega;\mathbf{R})$
$\gamma^{(2)}_{2\mathrm{EQ}}(\omega; \boldsymbol{R})$	$=$ \sum^{5}	$\hat{\mathcal{Q}}^{eg}_{\mu\alpha\nu\beta}(\omega,\omega_{eg}-\omega)F^{EQ}_{\mu\nu}(\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega,\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega,\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega,\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega,\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega,\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega,\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega,\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega,\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega,\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega,\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega,\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega,\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega,\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega,\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega,\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega,\omega,\omega_{eg}-\omega;\boldsymbol{R})F^{EQ}_{\alpha\beta}(\omega,\omega,\omega,\omega,\omega,\omega,\omega,\omega,\omega,\omega,\omega,\omega,\omega,\omega,\omega,\omega,\omega,\omega,\omega,$
$\langle \gamma_{2 EQ,0}(\omega) \rangle$ Vacuum	$\substack{\mu,\nu,\alpha,\beta=1\\\nu\geq\mu,\beta\geq\alpha}$	Emitter's position

Transition rate tailoring

- Normalized tensors: multipolar second-order transition moments
- Depend only on the electronic structure of the emitter
- Calculated analytically for a specific transition of the emitter

• Power emitted by a classical

- Emitter's position Tensors expressed as a function of Purcell factors of the two emitted quanta of complementary energy Depend only on the photonic environment Computed classically with COMSOL
- Multiphysics[®] (FEM)

 W_{arphi}

 W_0

- ✓ Agreement with the analytical results for the 2ED transition [2]
- ✓ Photon-pair emission rate enhanced by, respectively, 5 and 11 orders of magnitude for the 2ED and 2EQ transitions at $\omega = \omega_{eg}/2$
- \checkmark Emitter off-axis \rightarrow Additional peaks

Electric Dipole (ED)

Magnetic Dipole (MD)

Electric Quadrupole (EQ)

 $\Gamma_0^{(1)}$ **Decomposition** into radiative and non-radiative parts

 $-I \varphi$

 ω/ω_{eq} **Figure** – Relaxation channels of the 2EQ contribution to the total spectral TPSE rate for an emitter placed on-axis and off-axis under the nanodisk

Conclusion

Framework

- → Efficiently computes TPSE rate of a quantum emitter near an arbitrary shaped nanostructure and beyond the electric dipole approximation
- \rightarrow Based on the computation of Purcell factors via classical simulations
 - ✓ Avoids tedious analytic calculations

- Allows the study of complex geometries and design optimization \checkmark
- Allows the separate calculation of the radiative and non-radiative channels \checkmark

Application to a hydrogen-like emitter close to a silver nanodisk \rightarrow Enhancement

Perspective: study interference effects between multipolar TPSE channels [3]
