

# Soil-sensitive insights into land-system change : vulnerability and ecosystem services losses under artificialisation in Wallonia

Marie Pairon

Planetary Limits and Complex Risks: Developing Interdisciplinary Perspectives

December 2<sup>nd</sup>, 2025 – Solbosch

# WHY LAND-SYSTEM CHANGE MATTER ?

## “Soil strategy for 2030”

Long-term objectives laid down by the soil strategy is for the continent to achieve no net land take (NNLT) by 2050

## “Directive on Soil Monitoring and resilience (soil monitoring law)” – September 2025

To contribute to that long-term objective, it is important to assess the various processes of land take, and aim to reduce and mitigate their impact on soil health and ecosystem services.

# WHY LAND-SYSTEM CHANGE MATTER ?

Land take is a process which causes a modification of land use **and of the characteristics of the soil**. It can be seen as an overarching concept that can be subdivided into multiple aspects.

The first aspect of land take is a change from natural and semi-natural land uses towards settlement areas.

The second aspect of land take is soil artificialisation caused by the **durable alteration of the soil components and soil characteristics**, resulting in a loss of the capacity of soils to provide ecosystem services.

## OBJECTIVE AND CONTRIBUTION OF THE STUDY

Move from a surface-based binary approach to a soil-integrated perspective on artificialization.

Case study : Wallonia, 2007-2018

Aims:

1

Quantify land take and type of land use changes

2

Identify soil properties of artificialized soils

3

Assess the loss of ecosystem services provision

# METHODS – INTEGRATING LAND USE AND SOIL CHARACTERISTICS

1

Quantify land take and type of land use changes

Non artificialised

Meadow

Land use in 2007

# RESULTS - SURFACES

Land use in 2007 – Non artificialised

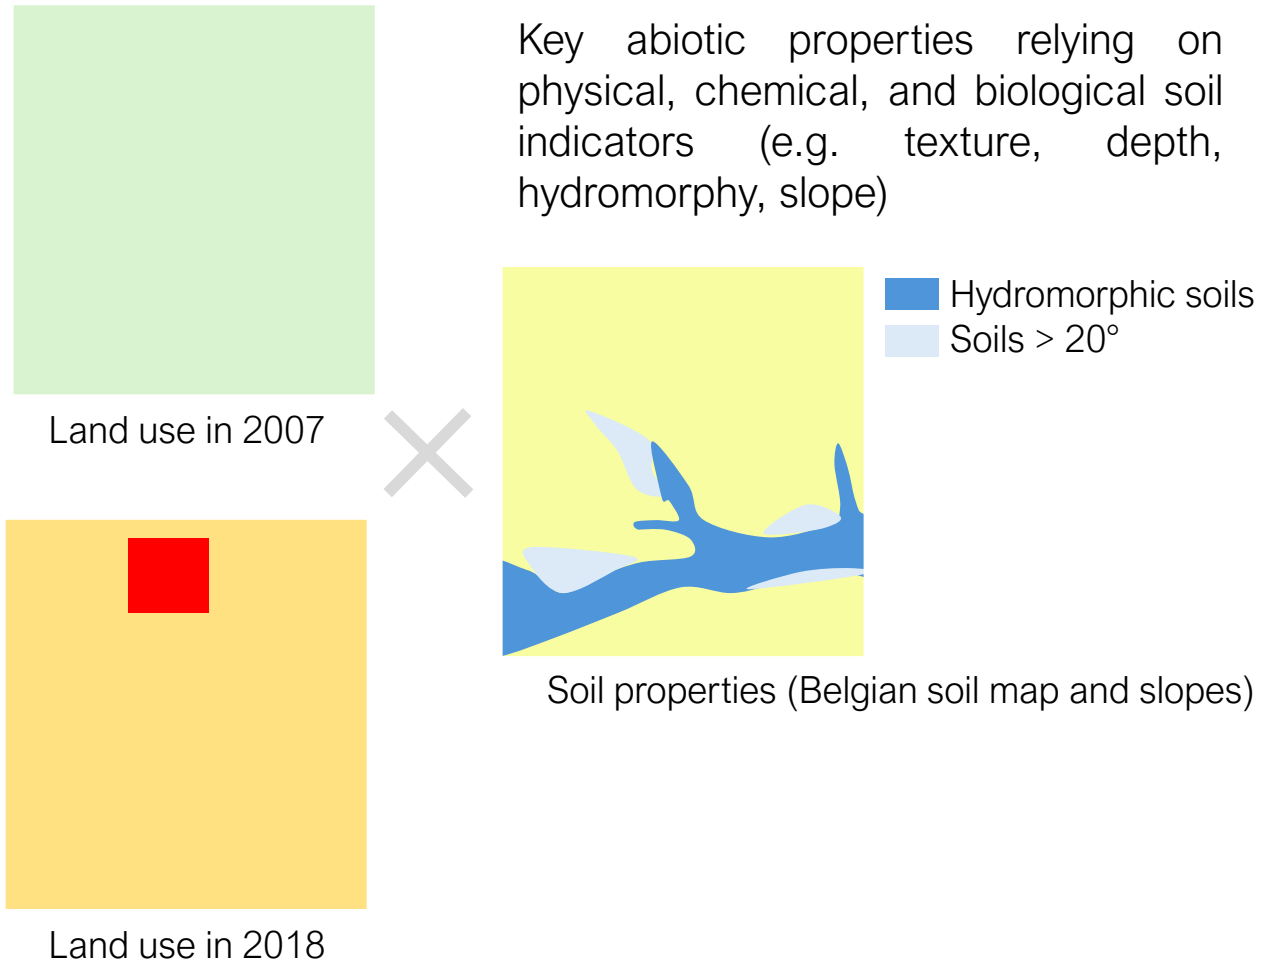

Land use in 2018 – Artificialised

# METHODS – INTEGRATING LAND USE AND SOIL CHARACTERISTICS

2

Identify soil properties of artificialized soils

## Results :

78% of the land that was taken from 2007 to 2018 was on 'non marginal' soils'

BUT

Up to 12% on peaty, para-peaty soil and hydromorphic soils (and 22% on environmentally constrained soils)

# METHODS – INTEGRATING LAND USE AND SOIL CHARACTERISTICS

3

Assess the loss for ecosystem services provision

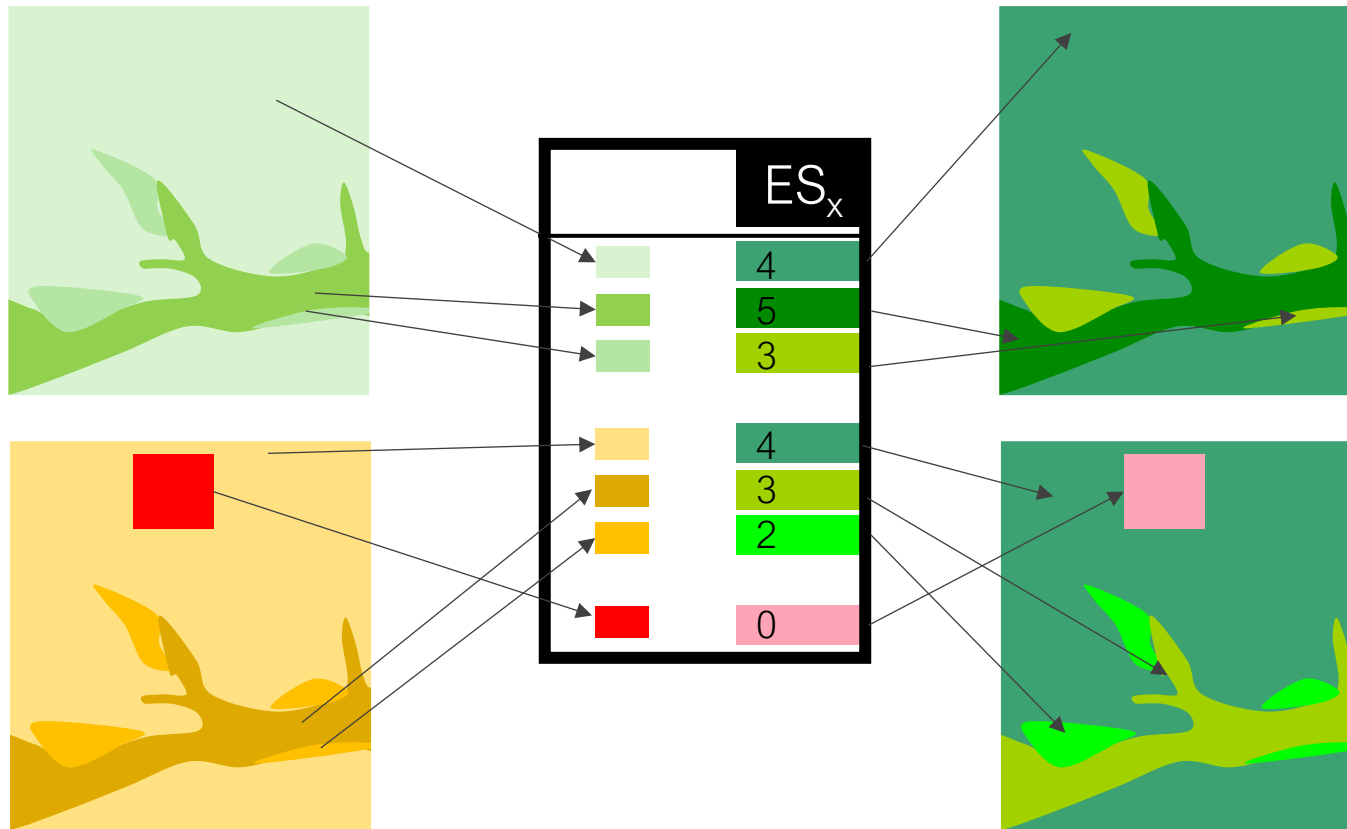

Ecosystem typology	Ecosystem services														
	Provisioning	Regulating	Cultural												
<ul style="list-style-type: none"><li>Meadow on non marginal soil conditions</li><li>Meadow on hydromorphic soils</li><li>Meadow on soils &gt; 20°</li> <li>Garden on non marginal soil conditions</li><li>Garden on hydromorphic soils</li><li>Garden on soils &gt; 20°</li> <li>Building</li></ul>	<table border="1"><tbody><tr><td>Not relevant</td><td>0</td></tr><tr><td>Very low</td><td>1</td></tr><tr><td>Low</td><td>2</td></tr><tr><td>Medium</td><td>3</td></tr><tr><td>High</td><td>4</td></tr><tr><td>Very high</td><td>5</td></tr></tbody></table> <p>Scale for ranking ES supply, flow or demand</p>			Not relevant	0	Very low	1	Low	2	Medium	3	High	4	Very high	5
Not relevant	0

Medium	3														
High	4														
Very high	5														

# METHODS – INTEGRATING LAND USE AND SOIL CHARACTERISTICS

3

Assess the loss for ecosystem services provision

Difference in the ability to provide service x between the projected situation and the initial situation

- Strong (positive)
- Medium (positive)
- Medium (negative)
- Strong (negative)

# RESULTS – LOSS OF ES PROVISION

A. ES provision before artificialisation

B. ES provision after artificialisation

C. Difference in ES provision

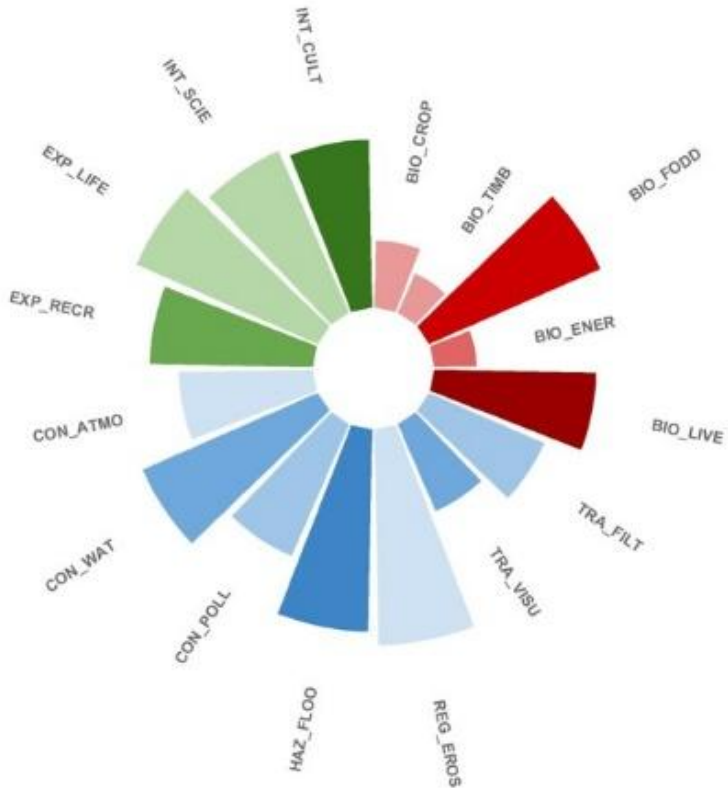

*BIO\_CROP* :Food crops,  
*BIO\_TIMB*: Timber and wood fiber,  
*BIO\_FODD*: Fodder (animals feed),  
*BIO\_ENER*: Wood and woody biomass  
 for energy,  
*BIO\_LIVE*: Livestock production,

*TRA\_FILT*: Filtration of airborne pollutants by  
 ecosystems,  
*TRA\_VISU*: Visual screening,  
*EROS*: Soil erosion control,  
*HAZ\_FLOO*: Flood risk mitigation,  
*CON\_POLL*: Pollination,  
*CON\_WAT*: Water quality regulation: surface water,  
*CON\_ATMO*: Global climate regulation via GHG  
 sequestration,

*EXP\_RECR*: Recreational experiences in the  
 environment,  
*EXP\_LIFE*: Living and working environment  
*INT\_SCIE*: Scientific and educational inspiration  
 and knowledge,  
*INT\_CULT*: Cultural, aesthetic and spiritual  
 inspiration

# RESULTS – LOSS OF ES PROVISION

## RESULTS – WHAT IS LEFT FOR RESIDENTIAL DEVELOPMENT ?

11.83 % of the total land reserve for residential development is still on environmentally constrained soils, representing 6 490 ha.

Hydromorphic soils are the most represented categories.

## DISCUSSION – KEY MESSAGES

Importance of moving beyond a simple binary distinction when assessing the impacts of land take on ecosystems.

Need for soil-specific indicators in planning:

- Distinguish soils by ecological function, not only by agricultural value.
- Avoid “silent losses” of high-service but low-productivity soils.

This study could help refining:

- Prioritisation frameworks for land protection;
- Soil-informed planning tools.
